

Visibility of the Chestnut Solar Project

The Chestnut Solar Project employed a third-party consultant to perform Viewshed Analysis of the project to simulate project vantage points over time. At this time, Chestnut Solar plans to place vegetation and buffering in strategic and sensitive locations around the perimeter of the site to limit view impacts of the Project from the nearby residences and roadways. The attached images show a progression over time of how the project may look from a point along the perimeter of the property.

Figure 1: The image below shows the existing view.

Figure 2: This image shows the same vantage point as Figure 1, but in this image the project is simulated.

Figure 3: This image shows the Project simulated with a proposed vegetation mix 5 -7 years after installation.
